Zace2 gene in a biological sample, as probes for in vivo diagnosis and for detecting and localizing Zace2 gene expression in tissue samples, to determine whether a subject's chromosomes contain a mutation in the Zace2 gene, and to detect aberrations associated with the Zace2 locus. Inhibitors of ACE are used for treating hypertension of various conditions, including left ventricular systolic dysfunction, progressive renal impairment, scleroderma renal crisis, congestive heart failure due to dysfunction, and treatment of atherosclerosis. Zace2 agonists may be used to treat infertility while Zace2 antagonists are used for inducing infertility. The present sequence represents a cDNA encoding the human
                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the metalloenzyme Zace2. Zace2, an angiotensin-converting enzyme is a zinc metallopeptidase that plays roles in blood pressure regulation and fertility. Zace2 can be expressed by standard recombinant methodology. Zace2 polypeptides are useful for treating an inflammatory bowel disease (e.g. Crohn's disease and ulcerative colitis), diseases associated with inflammation like arthritis and entercoolitis, as targets for identifying modulators of zinc protease activity, for screening or identifying new angiotensin-converting enzyme (ACE) inhibitors, and as a basis for rational drug design for inhibitory molecules. The nucleic acids can be used to detect the expression of a converting enzyme in the converting enzyme i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Angiotensin-converting enzyme, Zace2, useful for treating inflammatory bowel disease, e.g. Crohn's disease and ulcerative colitis, or diseases associated with inflammation such as arthritis and enterocolitis -

                                                                                                                                                                                                                                                                                        The present sequence encodes a human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a CDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang.(1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Fig 1; 138pp; English.

CDNA. ACE is also referred as peptidyl dipeptidase A. Nucleic acid sequence encoding ACE-2 is useful as antisense or antigene agents for sequence specific modulation of gene expression or in the analysis of single base-pair mutations in the gene. Nucleic acid sequence encoding ACE-2 is useful in therapeutics, diagnostics and in screening assays. ACE-2 antagonist is used to treat hypertension or congestive heart failure (CHF). ACE agonist is used to reduce the inflammation and pain resulting from an insect sting or bite, which was accompanied by an injection of bradykinin. Anti-ACE-2 antibodies are used to monitor ACE-2 protein levels for determining the disease or condition associated with an aberrant protein level.

                                                                                                                                                                                                                                                                                                                                            CC The present invention describes a new method of treating a body weight CC disorder, increasing muscle mass and decreasing body fat by CC administration of angiotensin converting enzyme (ACE)-2 modulating CC compound. The invention can be used for treating body weight disorders, CC particularly obesity of at least grade 1, diabetes, atherosclerosis and CC a state associated with lipid metabolism. The method is used for treating CC rapid weight loss, rapid weight gain, anorexia, cachexia, bulimia, CC generalised partial lipodystrophy, familial partial lipodystrophy, CC hypercholesterolaemia, hyperlipidaemia, an aberrant metabolic rate, CC congestive heart failure, chronic heart failure, left ventricular CC hypertrophy, acute heart failure, neurodegenerative disorders (e.g. CL alzheimer's disease, Parkinson's disease and Huntington's disease), CC Mizheimer's disease, Parkinson's disease and Huntington's disease, CC myocardial infarction, cardiomyopathy, systemic inflammation response CC syndrome, sepsis, polytrauma, inflammatorid arthritic and actor arthritic
                                                                                                                                                                                chronic pain, bone destruction in rheumatoid arthritis and osteoarthritis and periodontal disease, dysmenorrhoea, premature labour, brain oedema following focal injury, diffuse axonal injury, stroke, reperfusion injury, cerebral vasospasm after subarachnoid haemorrhage, allergic disorders including asthma, adult respiratory distress syndrome, wound healing and scar formation. The invention decreases the appetite, increases muscle mass and decreases body fat of subject having body mass index of greater than 23 (preferably 24.9)kg/m^2. The present nucleic acid sequence encodes the human ACE-2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-2000; 2000US-0704216

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosolerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is human full-length ACE-2 cDNA. The ACE-2 gene is located on the X chromosome at p21-22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Fig 1; 218pp; English.

                                                                                                                 CC PRO polypeptides, and to detect the presence of mammalian lung, colon, cc breast, prostate, rectal, cervical or liver tunours by comparing PRO polypeptide expression in a cell sample to that in a control sample. CC some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor alpha (TNF-alpha) from human blood, the crowdifferation or differentiation of chondrocytes, the proliferation or cc gene expression in pericyte cells, the release of proteoglycans from cc cartilage, the proliferation of inner ear utricular supporting cells or cf T-lymphocytes, the release of a cytokine from peripheral blood cc monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify comolecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, cc transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-DEC-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel human proteins (NHP) and the nucleic acids that encode them and antibodies raised against them. The proteins, antibodies and nucleic acids are useful in the diagnosis, prevention and/or treatment or diseases and/or disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human proteins, useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cardiovascular disorders, autoimmune disorders and reproductive disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 2911 BP; 896 A; 570 C; 655 G; 788 T; 2 other;

Zace2 polypeptides are useful for treating an inflammatory bowel disease (e.g. Crohn's disease and ulcerative colitis), concludes a stargets for identifying modulators of zinc protease activity, for contract and as a basis for rational drug design for inhibitory contracts. The nucleic acids can be used to detect the expression of a corez gene in a biological sample, as probes for in vivo diagnosis and context and to detect a conditions, including left ventricular systolic dysfunction, progressive conditions, and treatment of atherosclerosis. Zace2 agonists may be used to treat infertility while Zace2 antagonists are used for inducing conference infertility. The present sequence represents a cDNA encoding the mouse case2.5 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Angiotensin-converting enzyme, Zace2, useful for treating inflammatory bowel disease, e.g. Crohn's disease and ulcerative colitis, or diseases associated with inflammation such as arthritis and enterocolitis -

converting enzyme is a zinc metallopeptidase that plays roles in blood pressure regulation and fertility. Zace2 can be expressed by standard recombinant methodology. Zace2 polypeptides are useful for treating an inflammatory bowel disease (e.g. Crohn's disease and ulcerative colitis), diseases associated with inflammation like arthritis and enterocolitis, as targets for identifying modulators of zinc protease activity, for screening or identifying new anglotensin-converting enzyme (ACE) inhibitors, and as a basis for rational drug design for inhibitory molecules. The nucleic acids can be used to detect the expression of a Zace2 gene in a biological sample, as probes for in vivo diagnosis and for detecting and localizing Zace2 gene expression in tissue samples, to detecting whether a subject's chromosomes contain a mutation in the Zace2 gene, and to detect aberrations associated with the Zace2 locus. Inhibitors of ACE are used for treating hypertension of various conditions, including left ventricular systolic dysfunction, progressi renal impairment, scleroderma renal crisis, congestive heart failure d to dysfunction, and treatment of atherosclerosis. Zace2 agonists may bused to treat infertility while Zace2 antagonists are used for inducin infertility. The present sequence represents a cDNA encoding the mouse invention relates to the metalloenzyme Zace2. protein Zace2, an angiotensin progressive

molecules. The nucleic acids can be used to detect the expression of a Zace2 gene in a biological sample, as probes for in vivo diagnosis and for detecting and localizing Zace2 gene expression in tissue samples, to determine whether a subject's chromosomes contain a mutation in the Zace2 gene, and to detect aberrations associated with the Zace2 locus. Inhibitors of ACE are used for treating hypertension of various conditions, including left ventricular systolic dysfunction, progressive renal impairment, scleroderma renal crisis, congestive heart failure due to dysfunction, and treatment of atherosclerosis. Zace2 agonists may be used to treat infertility while Zace2 antagonists are used for inducing infertility. The present seminora represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pressure regulation and fertility. Zace2 can be expressed by standard recombinant methodology. Zace2 polypeptides are useful for treating an inflammatory bowel disease (e.g. Crohn's disease and ulcerative colitis), diseases associated with inflammation like arthritis and enterocolitis, as targets for identifying modulators of zinc protease activity, for
                                                                                                                                                                                                                                                                                                                                                                                                                             screening or identifying new angiotensin-converting enzyme (ACE) inhibitors, and as a basis for rational drug design for inhibitory molecules. The nucleic acids can be used to detect the expression of
                                                                infertility. The participation in the participation of the human
                                                                The present sequence represents a degenerate sequence human zace2 protein.

CC of a polyuncilectide agent that modulates the expression of the nucleic caid or its complement (i.e. gene therapy). The nucleic acid can be used to identify an agent that modulates the expression or activity of the cultic acid can be used to isolate the protein. The nucleic acid can be used in diagnostic assays for determining nucleic acid expression can be used in diagnostic assays for determining nucleic acid expression can see used in diagnostic assays for determining nucleic acid expression cas well as activity in the context of a biological sample (e.g., blood, configuration). The nucleic acid expression can see the context of a biological sample (e.g., blood, configuration) to determine whether an individual has a disease or configuration. The nucleic acid can be used to detect mutations in protease genes and gene can be used to detect mutations in protease genes and gene configuration probes to detect naturally-occurring genetic mutations in caprotease gene. The nucleic acid can be used as protease mediated disorders e.g., proliferative, developmental or haematopoietic disorders. The nucleic acid can be used as probes, primers, in biological assays, to determine patterns of gene expression, to design ribozymes and to construct transgenic animals. The present sequence represents one of the 268 cated human G-rotesion-confied rotease entrence.
                                                                                                                                                                                                                      80
